Treatment plan: extraction of 3.2 and placement of two JDEvolution® implants for the immediate rehabilitation of the lower incisors.
JDEvolution® implants placement with a flapless technique using a prosthetic guide. Platform-switched definitive titanium abutments were placed immediately following the surgical phase.
The temporary restoration was then relined in situ with acrylic resin, refined, polished and cemented.
After 3 months a conventional impression of the definitive abutments was made using a retraction cord.
The final restoration was seated avoiding abutment disconnection.
Clinical view and periapical radiograph taken 1 year later.
